Cyber Security Intro

- Cyber security is combination of two words CYBER and SECURITY.
  - Cyber means information that is in digital form on Internet and publicly available.
  - Security means we have to provide protection to these data that is available on internet.
- Definition of Cyber Security
  - Practice of protecting systems, networks, programs from Digital or Malicious Attacks.
  - These attacks are usually aim to accessing the information or destroying sensitive information.

- These attacks are usually aim to accessing the information or destroying sensitive information.

5 Virus
- A computer virus is a program that can copy itself and infect a computer without the permission or knowledge of the user.
- A computer virus has 2 major Characteristics:
  - The ability to replicate itself.
  - The ability to attach itself to another computer file.

6 Warning bells for Virus
- Frequent pop-up windows.
- Mass emails being sent from your email account.
- Frequent crashes.
- Unusually slow computer performance.
- Unknown programs that start up when you turn on your computer.
- Unusual activities like password changes.

7 Hacker and Hacking

7 Hacker and Hacking

8 Types of Hackers

- There are three types of hacker:
  - White hat hacker: It involves performing a security evaluation and testing with complete knowledge of the network infrastructure.
  - Grey hat Hacker: It involves performing a security evaluation and testing externally.
    - It examines the extent of access by insiders within the network.
  - Black hat Hacker: Testing with no prior knowledge of the network infrastructure or systems.
    - It takes longest amount of time and most efforts.

9 Types of Hacking

Hacker and Hacking

- HACKING is the gaining of access to a computer and viewing, copying or creating data without the intention of destroying data or maliciously harming the computer.
- A hacker is a person skilled in information technology who uses their technical knowledge to achieve a goal or overcome an obstacle, within a computerized system by non-standard means.
- Someone who utilizes their technical know-how of bugs or exploits to break into computer systems and access data which would otherwise be unavailable to them.

33 Propaganda Attacks (Contd.)

34 Economic Disruption

- Most modern economic systems operate using computers.
- Attackers can target computer networks of economic establishments such as stock markets, payment systems, and banks to steal money or block people from accessing the funds they need.

35 Sunrise Attacks

- These are the cyber equivalent of attacks like Pearl Harbor and 9/11.
- The point is to carry out a massive attack that the enemy isn't expecting, enabling the attacker to weaken their defenses

36 Cybercrime

- **Cybercrime** is a crime that involves a computer and a network.
- The computer may have been used in the commission of a crime, or it may be the target. Cybercrime may harm someone's security and financial health.

33

Propaganda Attacks (Contd.)

34

Economic Disruption

- Most modern economic systems operate using computers.
- Attackers can target computer networks of economic establishments such as stock markets, payment systems, and banks to steal money or block people from accessing the funds they need.

35

Sunrise Attacks

- These are the cyber equivalent of attacks like Pearl Harbor and 9/11.
- The point is to carry out a massive attack that the enemy isn't expecting, enabling the attacker to weaken their defenses

36

Cybercrime

- **Cybercrime** is a crime that involves a computer and a network.
- The computer may have been used in the commission of a crime, or it may be the target. Cybercrime may harm someone's security and financial health.

Economic Disruption

- Most modern economic systems operate using computers.
- Attackers can target computer networks of economic establishments such as stock markets, payment systems, and banks to steal money or block people from accessing the funds they need.

– Spamming: Spamming is the use of messaging systems to send multiple unsolicited messages to large numbers of recipients for the purpose of commercial advertising, for the purpose of non-commercial proselytizing, for any prohibited purpose, or simply sending the same message over and over to the same user.
– Password sniffing: Password sniffing is an attack on the Internet that is used to steal user names and passwords from the network. Man-in-the-middle attacks are commonly used for stealing passwords and credentials today.

• Steganography:
Attack Methods
• Physical Attack:
– Against computer facilities and/or transmission lines.
– Accomplished by use of conventional weapons to destroy or seriously injure computer and their terminal.
• Electronic Attack:
– Use of power of electromagnetic energy or electromagnetic pulse to overload computer circuitry.
• Cyber Attack:
– Use of malicious code to take advantage of software's weakness.

Socio-cultural motivations: examples include attacks with philosophical, theological, political, and even humanitarian goals. Socio-cultural motivations also include fun, curiosity, and a desire for publicity or ego gratification.
Attacks
Injection attacks
It is the attack in which some data will be injected into a web application to manipulate the application and fetch the required information.
Example- SQL Injection, code injection, log injection, XML Injection etc.
DNS Spoofing
DNS Spoofing is a type of computer security hacking. Whereby a data is introduced into a DNS resolver's cache causing the name server to return an incorrect IP address, diverting traffic to the attackers computer or any other computer. The DNS spoofing attacks can go on for a long period of time without being detected and can cause serious security issues.

79
Virus
It is a type of malicious software program that spread throughout the computer files without the knowledge of a user. It is a self-replicating malicious computer program that replicates by inserting copies of itself into other computer programs when executed. It can also execute instructions that cause harm to the system.
80
Worm
It is a type of malware whose primary function is to replicate itself to spread to uninfected computers. It works same as the computer virus. Worms often originate from email attachments that appear to be from trusted senders.
81
Trojan horse
It is a malicious program that occurs unexpected changes to computer setting and unusual activity, even when the computer should be idle. It misleads the user of its true intent. It appears to be a normal application but when opened/executed some malicious code will run in

86
In a distributed denial-of-service (DDoS) exploit, large numbers of compromised systems (sometimes called a botnet or zombie army) attack a single target.
87
Eavesdropping (tapping): the attacker simply listens to messages exchanged by two entities. For the attack to be useful, the traffic must not be encrypted. Any unencrypted information, such as a password sent in response to an HTTP request, may be retrieved by the attacker.
88
Traffic analysis: the attacker looks at the metadata transmitted in traffic in order to deduce information relating to the exchange and the participating entities, e.g. the form of the exchanged traffic (rate, duration, etc.). In the cases where encrypted data are used, traffic analysis can also lead to attacks by cryptanalysis, whereby the attacker may obtain information or succeed in unencrypting the traffic.
89
Software Attacks: Malicious code (sometimes called malware) is a type of software designed to take over or damage a computer user's operating system, without the user's knowledge or approval. It can be very difficult to remove and very damaging.

91
Virus and Spyware Protection policy:
It helps to detect threads in files, to detect applications that exhibits suspicious behavior.
Removes, and repairs the side effects of viruses and security risks by using signatures.
92
Firewall Policy:
It blocks the unauthorized users from accessing the systems and networks that connect to the internet.
It detects the attacks by cybercriminals and removes the unwanted sources of network traffic.

Intrusion Prevention policy:
This policy automatically detects and blocks the network attacks and browser attacks.
It also protects applications from vulnerabilities and checks the contents of one or more data packages and detects malware which is coming through legal ways.
